

Boost™
head positioner

listening... and delivering solutions®

In position for better outcomes...

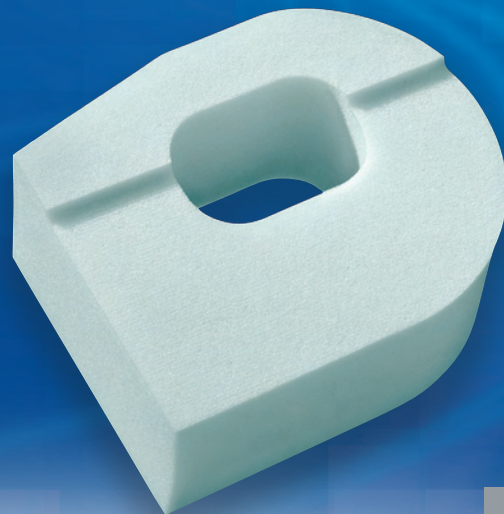

The Boost™ head positioner is designed to help stabilize a patient's head during ERCP, cradling it to enable easy access to the mouth for scope insertion and control throughout the procedure.

The Boost™ head positioner...

- Helps keep the head stable throughout the procedure for direct access to the mouth and airway
- Promotes proper patient alignment and comfort during long procedures
- Cradles the patient's head, helping to avoid pressure points
- Works for patients in prone, semi-prone, and left-lateral positions

- Traditional methods may allow the face to fall forward making it difficult to control scope insertion and maneuvering, and manage the airway

For more information on the Boost™ head positioner, contact US Endoscopy today.
